ABSTRACT

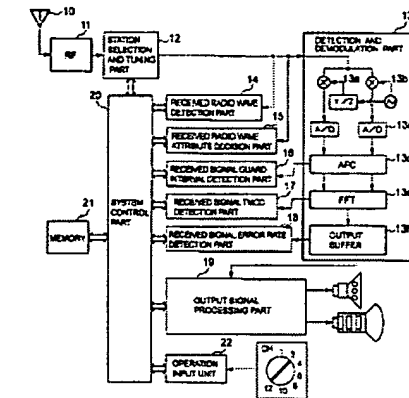

A broadcast receiver which detects the reception status of radio waves from other stations without disturbing the reception status of a currently-receiving station, is digital broadcasting where a transmission time slot is reserved. The amount of reserved bandwidth applied to the currently-receiving station is determined so that the reception status of the radio waves from other stations is detected while the reception of the currently-receiving broadcast station is interrupted within the reserved time slot. The amount of reserved bandwidth can be determined by such a receiver and can be determined by such a receiver.
